Governing Human–AI Collaborative Project Workflows in Multi-Platform Digital Delivery

Design Science study · HuaiCheng Sheng, Agentic Work Lab · Agentic Work Lab and PublishOps CrossCast

Problem

Agents now act on platforms whose actions cannot be undone

- A retried upload can publish twice: web submission offers no idempotency key
- An approved plan can drift from the file that is actually uploaded
- Young AI-series videos and years-old videos invite false claims of AI gains

Research questions: governance design (RQ1), idempotent release (RQ2), evidence (RQ3)

→

Four governance layers

1 Admission gate (planRun)
owner, stop flag, running lock, authorized due jobs → a plan, never an action

2 Content binding
--confirm must present the plan digest; media checked by SHA-256

3 At-most-once receipt
saved as UNKNOWN before the one final press; no automatic re-press

4 End-to-end read-back + people
read-back closes the gate; a person settles in-doubt cases

→

Field evidence (26 Oct–3 Nov 2026)

- 69-record journal: 1 platform write, no replayed upload recorded
- Douyin read-back timed out: receipt kept UNKNOWN, no re-upload, owner confirmed
- One Instagram run: 92.32% of the 412.217 s publish command was the wait after Share
- 2,737 offline test functions (commit 75b7abc); 30 video versions, 2.21 GB, SHA-256 recorded
- 55 channel records reported descriptively; no causal claim about AI production

Single-case evidence from one laboratory · code, data and a script that recomputes every figure are public
